New antigenic peptide from the CH3 domain of immunoglobulin E, fusions for immunization against allergy.

Claim 1; Page 99; 155pp; English.

The present invention describes immunoglobulin E (IgE)-CH3 domain antigenic peptides (I). (I) have anti-allergic, anti-anaphylactic and anti-asthmatic properties. (I) induces polyclonal antibodies specific for a target effector site on the epsilon-heavy chain of IgE, and so preventing triggering and activation of mast cells and basophils and downregulation of IgE synthesis. Conjugates, or fusion peptides, or containing (I) are used for active immunisation against IgE-mediated allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy dermattisis. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (I) that include a promiscuous T helper cell epitope

```
This invention describes a novel antigenic peptide comprising amino acid residues of an IGE CH3 domain from a first species (ADE1) and amino acid residues of an IGE CH3 domain of a second unrelated species (ADE2), where ADE1 is conserved in the IGE CH3 domain of the second species and ADE2 is not conserved in the IGE CH3 domain of the first species. The novel antigenic peptide induces a non-anaphylacidistic peptide induces a non-anaphylacidistic sequence an animal. The invention also discloses the polymucleotide sequence an animal. The invention also discloses the polymucleotide sequence carcier, where the fusion protein antigenic peptide of the invention and a heterologous protein comprising the antigenic peptide and an antigenic fusion protein induces an anti-IGE immune response the invention have dermatological, antihilammatory and ophthalmological activity. The antigenic peptide described is capable of products of the invention have dermatological, antihilammatory and ophthalmological activity. The antigenic peptide described is capable of preventing IGE from binding to high affinity receptors on mast cells and basophils. The products of the invention are useful in the manufacture of a medicament for treating or preventing IGE-mediated allergic disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel isolated antigenic peptide comprising amino acid residues of CH3 domain of IgE molecule from first species and a second unrelated species, induces non-anaphylactic anti-IgE immune response in animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CH3 domain; IgB; antigen; non-anaphylactic; anti-IgB; fusion protein; dermatordical; antinflammatory; ophthalmological; allergy, asthma; allergic rhinitis; gastrointestinal allergy; food allergy; eosinophilla; conjunctivitis; glomerular nephritis; flea allergy; atopic dermatitis;
(functional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and maximize cross-reactivity to the natural target. They induce safe (non-anaphylactogenic) antibodies. AA779994 to AA780084 represent amino acid sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

including asthma, allergic rhinitis, gastrointestinal allergies such as food allergies, eoshnophilia, conjunctivitis, glomerular nephritis, flea allergies or atopic dermatitis, in an animal, e.g. human or dog. The polynucleotide products are useful for treating igE-mediated allergic disorders, by gene therapy. Antigenic peptides comprising conserved amino acid residues of the CH3 domain of an IgE molecule from one species molecule from one species molecule from a second unrelated species are capable of inducing a high titre of anti-IgE anticolaise when administered to an animal without causing anaphylaxis. ABG74772-ABG74785 represents polypeptide sequences in designing the constructs described in the disclosure of the
                                                                                                                                                                                                                                                                                                                                         ·:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes immunoglobulin E (IgE)-CH3 domain antigenic peptides (I). (I) have anti-allergic, anti-anaphylactic and anti-asthmatic properties. (I) induces polyclonal antibodies specific for a target effector site on the spailon-heavy chain of IgE, and so preventing triggering and activation of mast cells and basophils and downregulation of IgE synthesis. Conjugates, or fusion peptides, containing (I) are used for active immunisation against IgE-mediated dermatitis. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (I) that include a promiscuous T helper cell pitcope (functional in generically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Immunoglobulin E; IgE; epsilon heavy chain; antigenic; antigen; immunoglobulin lattory; carrier protein; helper T cell epitope; antibody; allergy; allergic disease; immunisation; anti-allergic; anti-antantiantian anti-anaphylactic; anti-asthmatic; asthma; anaphylaxis; dermatitis.

The present sequence is an immunogenic peptide consisting of the heavy chain constant regions 2 and 4 of the opossum IgB and the heavy chain constant region 3 from the rat. It was shown to cause a stronger polyclonal anti-self IgE response than peptides consisting of the same regions from one mammal. Immunogenic peptides, particularly those consisting of different heavy chain constant regions, can be used for vaccination in humans, against bacterial and viral infections and allergies, such as asthma, fur, pollen and food allergies and eczema. (Updated on 12-SEP-2003 to standardise OS field)
                                                                                                                          Immunogenic peptide consisting of opossum CH2, rat CH3 and opossum CH4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Immunogenic polypeptides useful for preventing the harmful effects of immunoglobulin \mathbb E in mammals.

It was used to construct a number of immunogenic peptides which consisted of regions of IgE from different mammals, which appear to cause a stronger polyclonal anti-self IgE response than peptides consisting of the same regions from one mammal. Immunogenic peptides, particularly those consisting of different heavy chain constant regions, can be used for vaccination in humans, against bacterial and viral infections and allergies, such as
constraints (disulfide bridge) to stabilise conformational features and maximize cross-reactivity to the natural target. They induce safe (non-anaphylactogenic) antibodies. AAY79994 to AAY80084 represent amino acid sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

Rat IgE heavy chain amino acid sequence SEQ ID NO:34.

immunogenic;

```
This invention describes a novel antigenic peptide comprising amino acid residues of an IgE CH3 domain from a first species (ADE1) and amino acid residues of an IgE CH3 domain of a second unrelated species (ADE2), where DEE1 is conserved in the IgE CH3 domain of the first species. The novel antigenic peptide induces a non-anaphylactic antifgE immune response in an animal. The invention also discloses the polynucleotide sequence an animal. The invention also discloses the polynucleotide sequence arrier, where the fusion protein induces an anti-IgE immune response that does not cause anaphylaxis when administered to an animal. The products of the invention nave dermatological, antifilammatory and products of the invention have dermatological, antifilammatory and basophils. The products of the invention are useful in the manufacture of medicament for treating to preventing IgE from binding to high affinity receptors on mast cells and basophils. The products of the invention are useful in the manufacture of medicament for treating to preventing IgE-mediated allergies such as food allergies, ecsinophilia, conjunctivitis, glomerular nephritis, flea allergies, ecsinophilia, conjunctivitis, glomerular nephritis, flea clistoders, by gene therapy. Antigenic peptides comprising conserved amino acid residues of the CH3 domain of an IgE molecule from a second unrelated species are capable of inducing a high that a particular residues of the CH3 domain of an IgE molecule from a second unrelated species are capable of inducing a high residue of antimal residues of the capable of inducting a high relation of an immulative of anti-IgE antibodies when administered to an animal a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel isolated antigenic peptide comprising amino acid residues of CH3 domain of IgE molecule from first species and a second unrelated species, induces non-anaphylactic anti-IgE immune response in animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                causing anaphylaxis. ABG74772-ABG74785 represents polypeptide sequences used in designing the constructs described in the disclosure of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    84.1%; Score 122; DB 6; Length 346; 95.7%; Pred. The present invention describes a method (M1) for identifying peptides that induce cytotoxic T-lymphocyte (CTL) response against immunoglobulin E [19E], comprising providing a test peptide (T) suspected of being able to bind to major histocompatibility complex (MHC) class I molecule, and evaluating (T) for ability to elicit in a mammal a CTL response to naturally processed and presented 19Es peptides, where a peptide that induces such a response is identified. Also described are compositions:

(C1) comprising at least one immunogenic peptide (I) identified by (M1);

(C2) comprising at least one immunogenic peptide (I) identified by (M1);

(C2) comprising at least one immunogenic peptide (I) identified by (M1);

(C3) comprising at least one immunogenic peptide (I) identified by (M1);

(C3) comprising at least one intune geals that recognise at least one (I).

Where C1-3 are able to bind to at least one MHC class I molecule and to elicit in a mammal a CTL response to naturally processed and presented 19E peptides. C1-3 have antiallergic, antiasthmatic, immunosuppressive, vasotropic, dermatological, antialfammatory and cytostatic activities, and can be used as inducers of a CTL response against 19E, and in a vaccines. C1-3 can be used for modulating an IgE-mediated condition in a mammal at curse and the modulating an IgE-mediated condition in a mammal and the condition and a person of the mammal c1-3 that modulating an IgE-mediated condition as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               .

Preferably, Cl-3 are useful for tracting atopic hypersensitivity conditions (such as allergic rhinitis, allergic asthma, food allergies, or atopic dermatitis), non-atopic hypersensitivity conditions (such as anaphylaxis, and urticaria hives). The present sequence represents an IgE heavy chain amino acid sequence, which is given in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes immunoglobulin E (IgE)-CH3 domain antiganic peptides (I). (I) have anti-allergic, anti-anaphylactic and antiganic peptides (I). (I) have anti-allergic, anti-anaphylactic and antiganic perpeties. (I) induces polyclonal antibodies specific of a target effector site on the epsilon-heavy chain of IgE, and so preventing triggering and activation of mast cells and bascphils and downregulation of IgE synthesis. Conjugates, or fusion peptides, containing (I) are used for active immunisation against IgE-mediated allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy dermatities. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (I) that include a promiscuous T helper cell epitope (functional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and maximize cross-reactivity to the natural target. They induce safe (non-anaphylactogenic) antibodies. AAY9994 to AAY80084 represent amino acid sequences used in the exemplification of the present invention

antigenic peptides (1). (1) have anti-allergic, anti-anaphylactic and antigenic peptides (1). (1) have anti-allergic, anti-anaphylactic and antigenic peptides (1) induces polyclonal antibodies specific for a target effector afte on the epsilon-heavy chain of 1gB, and so a target effector afte on the epsilon-heavy chain of 1gB, and so containing triggering and activation of mast cells and basophils and downrequiation of 1gB synthesis. Conjugates, or fusion peptides, containing (1) are used for active immunication against 1gB-mediated allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy dermatritis. Nucleic acids that encode these compounds are useful for combinant production of corresponding peptides or in DNA vaccines. Conjugates of (1) that include a promiscuous T helper cell epitope (1) that include a promiscuous T helper cell epitope (1) that include a promiscuous T helper cell epitope (1) trace and inverse subjects), in addition to a B cell carget epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and maphylactogenic) antibodies. AAY9994 to AAY80084 represent amino acid sneaphylactogenic) antibodies. AAY9994 to AAX80084 represent amino acid sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           epitope;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New antigenic peptide from the CH3 domain of immunoglobulin E, fusions for immunization against allergy.

The present invention describes immunoglobulin E (IgE)-CH3 domain

antigenic peptides (I). (I) have anti-allergic, anti-anaphylactic and

antigenic properties. (I) induces polyclonal antibodies specific

at anti-estimatic properties. (I) induces polyclonal antibodies specific for

a target effector site on the epsilon-heavy chain of IgE, and so

c at arget effector site on the epsilon-heavy chain of IgE, and so

containing triggering and activation of mast cells and basophils and

containing (I) are used for active immunisation against IgE-mediated

containing (I) are used for active immunisation against IgE-mediated

containing (I) are used for active immunisation against IgE-mediated

containing production of corresponding peptides or in DNA vaccines.

correcombinant production of corresponding peptides or in DNA vaccines.

Conjugates of (I) that include a promiscuous T helper cell epitope (functional in genetically diverse subjects), in addition to a B cell

c target epitope, have increased immunogenicity and may include cyclic

constraints (disulfide bridge) to stabilise conformational features and

constraints (alsulfide bridge) to stabilise conformational features and

c maximize cross-reactivity to the natural target. They induce safe (non-

c anaphylactogenic) antibodies. AAY19094 to AAY80084 represent amino acid

constraints (non-measure and the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      g
                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes immunoglobulin E (IGE)-CH3 domain antigenic peptides (I). (I) have anti-allergic, anti-anaphylactic and antigenic peptides (I). (I) have anti-allergic, anti-anaphylactic and antigenic properties. (I) induces polyclonal antibodies specific (a target effector site on the epsilon-heavy chain of IGE, and so preventing triggering and activation of mast cells and basophils and downward (I) are used for active immunisation against IGE-mediated allergies, e.g. food allergies, sorbma, anaphylaxis, or flea-allergy dermaities. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (I) that include a promiscuous T helper cell politope (functional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and maphylactogenic) antibodies. APY 9994 to AAY80084 represent amino acid sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Immunoglobulin B; 1gB; epsilon heavy chain; antigenic; antigen; immunoglopenic; immunosfimulatory; carrier protein; helper T cell epitope; antibody; allergy; allergic disease; immunisation; anti-allergic; anti-anaphylactic; anti-achmatic; asthma; anaphylaxis; dermatitis.
                                                                                                                                                                                                                                                                                           New antigenic peptide from the CH3 domain of immunoglobulin E, fusions for immunization against allergy.

                                           The present invention describes immunoglobulin E (IgE)-CH3 domain antigenic peptides (I). (I) have anti-allergic, anti-anaphylactic and antigenic peptides (I). (I) have anti-allergic, anti-anaphylactic antigenic peptides (I) induces polyclonal antibodies specific for a target effector site on the epsilon-heavy chain of IgE, and so preventing triggering and activation of mast cells and basophils and downregulation of IgE synthesis. Conjugates, or fusion peptides, containing (I) are used for active immunisation against IgE-mediated allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy dermatities. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (I) that include a promiscuous T helper cell epicope (functional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and maphylaxing cross-reactivity to the natural target. They induce safe (nonanaphylaxing) antibodies. AAY19994 to AAY80084 represent amino acid sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes immunoglobulin E (IGE)-CH3 domain antigenic peptides (I). (I) have anti-allergic, anti-anaphylactic and anti-asthmatic properties. (I) induces polyclonal antibodies specific for a target effector site on the epsilon-heavy chain of IGE, and so preventing triggering and activation of mast cells and basophils and downregulation of IGE synthesis. The present invention describes immunoglobulin E (IgE)-CH3 domain antigenic peptides (I). (I) have anti-allergic, anti-anaphylactic and antisedimatic properties. (I) induces polyclonal antibodies specific for a target effector site on the epsilon-heavy chain of IgE, and so preventing triggering and activation of mast cells and basophils and contenting triggering and activation of mast cells and basophils and containing (I) are used for active immunisation against IgE-mediated allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (I) that include a promiscuous T helper cell epitope (functional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0
containing (I) are used for active immunisation against IgE-mediated allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy defermatitis. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (I) that include a promiscuous T helper cell epitope (functional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and maximize cross-reactivity to the natural target. They induce safe (non-anaphylactogenic) antibodies. AAY79994 to AAY80084 represent amino acid sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Immunoglobulin B; IgB; epsilon heavy chain; antigenic; antigen; immunogenic; immunostimulatory; carrier protein; helper T cell epitope; antibody; allergy; allergic disease; immunisation; anti-allergic; anti-anaphylactic; anti-asthmatic; asthma; anaphylaxis; dermatitis.

```
antigenic peptides (I). Induces polyclonal antibodies specific anti-aschmatic properties. (I) induces polyclonal antibodies specific for a target effector site on the epsilon-heavy chain of 19E, and so containing triggering and activation of mast cells and bacophils and downregulation of IgE synthesis. Conjugates, or fusion peptides, containing (I) are used for active immunisation against IgE-mediated allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy dermatitis. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (I) that include a promiscuous T helper cell epitope (functional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and maximize cross-reactivity to the natural target. They induce safe (nonamphylactogenic) antibodies. AAV19994 to AAV80084 represent amino acid anaphylactogenic) antibodies. AAV19994 to AAV80084 represent amino acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Immunoglobulin E, IgE; epsilon heavy chain; antigenic; antigen; immunogenic; immunogenic; immunogenic; immunosimulatory; carrier protein; helper T cell epitope; antibody; allergy; allergic disease; immunisation; anti-allergic; anti-antaphylactic; anti-athmatic; asthma; anaphylaxis; dermatitis.
maximize cross-reactivity to the natural target. They induce safe (non-anaphylactogenic) antibodies. AAY79994 to AAY80084 represent amino acid sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New antigenic peptide from the CH3 domain of immunoglobulin E, fusions for immunization against allergy.
                                                                                                                                                               Gaps

antigenic peptides (1). (1) have anti-allergic, anti-anaphylactic and antigenic peptides (1). (1) have anti-allergic, anti-anaphylactic and antigenic peptides (1). (1) have anti-allergic, anti-anaphylactic and antiacture at the antibodies specific for a target effector site on the epsilon-heavy chain of 195, and so a target effector site on the epsilon of mast cells and basophils and downregulation of 195 synthesis. Conjugates, or fusion peptides, containing (1) are used for active immunisation against 195-mediated allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy certaities. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (1) that include a promiscuous T helper cell epitope (functional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and maphylactogenic) antibodies. Axy1994 to AAX80084 represent amino acid snaphylactogenic) antibodies. Axy1994 to AAX80084 represent amino acid sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              o;

The specification describes peptide immunogens comprising a synthetic releasing hormone (IHRH). The peptide immunogens cause induction of a specific immune response to LHRH which is involved in regulation of a specific immune response to LHRH which is involved in regulation of spermatogenesis, ovulation, cestrus, sexual development and secretion of sex hormones. Provision of a promiscuous T helper epitope (which is functional in genetically diverse subjects) provides optimum immunogenicity to the B cell epitopes of the target antigen and thus high antibody titres against the target antigen. The peptide immunogens of the invention are used to vaccinate against mammalian LHRH, for use as (reversible) contraceptive; control of hormone-dependent tumours (cancer of prostate or breast, also endometriosis); to prevent boar taint (and improve meat quality) and for immunocastration. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                             New peptide immunogen containing luteinizing hormone-releasing hormone antigen site and helper T cell epitope, for e.g. contraception and treatment of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ô

helper T cell (Th) epitope and a target antigen, luteinising hormone-releasing hormone (LHRH). The peptide immunogens cause induction of a specific immune response to LHRH which is involved in regulation of a promise. Every sexual development and secretion of sex hormones. Frovision of a promiscuous T helper epitope (which is functional in genetically diverse subjects) provides optimum and thus high attibody titres against the target antigen. The peptide immunogens of the invention are used to vaccinate against mammalian LHRH, for use as (reversible) contraceptive; control of hormone-dependent tumours (cancer of prostate or breast, also endometricosis); to prevent boar taint (and appears in the specification.

New artificial T helper cell epitope and derived immunogens with target antigenic site, for immunization against e.g. malaria, arteriosclerosis antigenic site, for immunization or human immune deficiency virus.

Example 6; Page 40; 129pp; English.

The invention relates to novel promiscuous T helper cell epitopes (Th), and immunogenic peptides comprising the Th epitopes of the invention along with B cell epitopes. The Th epitopes and peptide immunogens containing them, are used to induce a T helper cell response, specifically against Plasmodium falciparum, cholestery! ester transport protein (CETP) or HIV epitopes, but more generally against any pathogen, immunoreactive self-antigen or tumour antigen. The Th epitopes and 

communications (HIV) foot-and-mouth disease or malaria); for cancer infections (HIV) foot-and-mouth disease or malaria); for cancer communications (HIV) foot-and-mouth disease or malaria); for cancer infections (HIV) foot-and-mouth disease or malaria); for cancer communications (HIV) foot-and-mouth disease or malaria); for cancer cleasing hormone (HIRB) for contraception, treatment of hormone-cleasing hormone contracts are contracted inferences and management and management and managementally diverse subjects) into an immunogan improves capacity to conduct on of antibodies against a target antigen. The can replace carrier proteins and pathogen-derived Thelper epitopes. Sequence AAV91121 contracts and pathogen-derived Thelper epitopes sequence AAV91121 contracts and pathogen-derived Thelper epitopes sequence AAV91121 contracts and pathogen-derived Thelper epitopes sequence AAV91121 contracts and AAV91224 contracts and sequences AAV91142. Pathogen-derived from the HIV epitopes have not the NVF Thelpitope. Sequence AAV91143 represents a promiscuous Thelpitope from the map to peptides comprising an LHRH sequence joined to a promiscuous Thelpitope. AAV91167 is the LHRH target antigenic peptide comprising somatcostatin and a Thelpitope. AAV91201 are antigenic peptides comprising somatcostatin and and AAV91201 are antigenic peptides comprising somatcostatin and and peptides. AAV91201 are antigenic peptides comprising somatcostatin and and peptides. AAV91201 are antigenic peptides which may be used to prevent HIV infection of The Company of The Company of Thelpitope. AAV91220 is a peptide from the AV91221 v91225 comprise the Competence of a human 19E (immunogens end AAV91221 v91225 comprise the competide and a Thepitope. AAV91220 is a peptide ferived from the comprise the Competence of antigen and a Thepitope and and AAV91221 v91225 comprise the competide and and MVPT The peptide and and antigenic and and AAV91221 are HIV-1 neutralising a CTP-derived peptides and and AAV9128 - v91231 are antigenic peptides and and AAV9

                                                                                                                                                                                                                                                                                                                                                                                                              엄
                                                                                                                                                                 The present invention describes immunoglobulin B (IgB)-CH3 domain antiganic peptides (1). (1) have anti-allergic, anti-anaphylactic and antiganic peptides (1). (1) induces polyclonal antibodies specific or a target effector site on the epsilon-heavy chain of IgB, and so reventing triggering and activation of mast cells and basophils and downrequiation of IgB synthesis. Conjugates, or fusion peptides, containing (1) are used for active immunisation against IgB-mediated allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy dermattis. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (1) that include a promiscuous T helper cell epitope (functional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and maphylactogenic) antibodies. AAY9994 to AAX80084 represent amino acid sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        .

The present invention describes immunoglobulin E (IgE)-CH3 domain antigenic peptides (I). (I) have anti-allergic, anti-anaphylactic and antigenic properties. (I) induces polyclonal antibodies specific a target effector site on the epsilon-heavy chain of IgE, and so preventing triggering and activation of mast cells and basophils and downregulation of IgE synthesis. Conjugates, or fusion peptides, containing (I) are used for active immunisation against IgE-mediated alergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy dermatitis. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (I) that include a promiscuous T helper cell epitope (functional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and maximize cross-reactivity to the natural target. They induce safe (non-anaphylactogenic) antibodies. Axy3994 to AAX80084 represent amino acid sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Helper T cell epitope; peptide immunogen; LHRH; luteinising hormone-releasing hormone; spermatogenesis; ovulation; luteinising hormone; sex hormone; promiscuous T helper epitope; ostrus; sexual development; sex hormone; promiscuous T helper epitope; vaccine; contraceptive; hormone-dependent tumour; prostate cancer; breast cancer; endometriosis; boar taint; meat quality; immunocastration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New peptide immunogen containing luteinizing hormone-releasing hormone antigen site and helper T cell epitope, for e.g. contraception and treatment of cancer.
New antigenic peptide from the CH3 domain of immunoglobulin E, fusions for immunization against allergy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The specification describes peptide immunogens comprising a synthetic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes immunoglobulin E (IGE)-CH3 domain antigenic peptides (I). (I) have anti-allergic, anti-anaphylactic and antigenic peptides (I). (I) have anti-allergic, anti-anaphylactic and artiger features polyclonal antibodies specific for a target effector site on the epsilon-heavy chain of IgB, and so preventing triggering and activation of mast cells and basephils and downregulation of IgB synthesis. Conjugates, or fulsion peptides, containing (I) are used for active immunisation against IgE-mediated allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy dermatitis. Nucleic ands that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (I) that include a promiscuous T helper cell epitope (functional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and maximize cross-reactivity to the natural target. They induce safe (non-snaphylactogenic) antibodies. AAV79994 to AAV80084 represent amino acid sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Immunoglobulin E; IgE; epsilon heavy chain; antigenic; antigen; immunoglobulin immunostimulatory; carrier protein; helper T cell epitope; antibody; allergy; allergic disease; immunisation; anti-allergic; anti-anaphylactic; anti-asthmatic; asthmat anaphylaxis; dermatitis.

The present invention describes immunoglobulin E (IGE)-CH3 domain antigenic peptides (I). (I) have anti-allergic, anti-anaphylactic and antigenic properties. (I) induces polyclonal antibodies specific canti-asthmatic properties. (I) induces polyclonal antibodies specific cantiarget effector site on the epsilon-heavy chain of IGE, and so a target effector site on the epsilon-heavy chain of IGE, and so containing (I) are used for active immunisation against IGE-mediated allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy dermatties. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (I) that include a promiscuous T helper cell epitope (I) that include a promiscuous T helper cell epitope (I) that include a promiscuous T helper cell epitope (I) that include a promiscuous T helper cell epitope (I) that include a promiscuous T helper cell epitope (I) that include a promiscuous T helper cell epitope (I) that include a promiscuous T helper cell epitope (I) that include a promiscuous C (I) that I) that I tha
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ô

The present invention describes immunoglobulin E (IgE)-CH3 domain antigenic peptides (I). (I) have anti-allergic, anti-anaphylactic and antigenic peptides (I). (I) have anti-allergic, anti-anaphylactic and antigenic peptides (I) induces polyclomal antibodies specific for a target effector site on the epsilon-heavy chain of IgE, and so preventing triggering and activation of mast cells and basophils and downregulation of IgE synthesis. Conjugates, or fusion peptides, containing (I) are used for active immunisation against IgE-mediated allergys (I) are used for active immunisation against IgE-mediated allergys allergies, e.g. food allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy dermatities. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (I) that include a promiscuous T helper cell epitope (functional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and maximize cross-reactivity to the natural target. They induce safe (non-anaphylactogenic) antibodies. AAY9994 to AAY80084 represent amino acid sequences used in the exemplification of the present invention

```
The present invention describes immunoglobulin E (IgB)-CH3 domain antigenic peptides (I). (I) have anti-allergic, anti-anaphylactic and antigenic peptides (I). (I) have anti-allergic, anti-anaphylactic and antigenic properties. (I) induces polyclonal antibodies specific for a target effector site on the epsilon-heavy chain of IgB, and so preventing triggering and activation of mast cells and basophils and downregulation of IgB synthesis. Conjugates, or fusion peptides, containing (I) are used for active immunisation against IgB-mediated allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy dermartitis. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. (Conjugates of (I) that include a promiscuous T helper cell epitope (functional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      al target. The present invention describes a method (MI) for identifying peptides that induce cytotoxic T-lymphocyte (CTL) response against immunoglobulin E [192], comprising providing a test peptide (T) suspected of being able to bind to major histocompatibility complex (MHC) class I molecule, and evaluating (T) for ability to elicit in a mammal a CTL response to naturally processed and presented igE peptides, where a peptide that induces such a response is identified. Also described are compositions: (C1) comprising at least one immunogenic peptide (I) identified by (MI); (C2) comprising at least one immunogenic peptide (I) identified by (MI); (C2) comprising antigen-presenting cells that recognise at least one (I). Where C1-3 are able to bind to at least one MHC class I molecule and to clicit in a mammal a CTL response to maturally processed and presented igE peptides. C1-3 have antiallered; antiasthmatic, immunosuppressive, vasotropic, dermatological, antiaflammatory and cytostatic activities, and can be used as inducers of a CTL response against IgE, and in vaccines. C1-3 are useful for modulating an IgE-mediated condition in mammal. C1-3 are useful for modulating an IgE-mediated condition in mammal. C1-3 are useful for modulating an igE-mediated condition as mammal. Enemalized atopic hypersensitivity condition, IgE mediated non-atopic hypersensitivity condition, IgE mediated atopic cuseful for treating atopic hypersensitivity conditions (such as allergic useful for treating atopic hypersensitivity conditions (such as allergic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Identifying peptides that induce cytotoxic T-lymphocyte, CTL response against IgE, by identifying peptide eliciting CTL response to IgE peptides naturally presented by major histocompatibility complex class I
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Immunoglobulin E, vaccine, IgE, cytotoxic T lymphocyte response, immune response, major histocompatibility complex, MHC; immunogenic, antiallergic, antiasthmatic, immunosupressive, vasotropic, cytostatic, dermatological; antiinflammatory; IgE-mediated condition; food allergy, atopic hypersensitivity condition, allergic rhinitis, allergic asthma, atopic dermatitis; non-atopic hypersensitivity condition; anaphylaxis;

(I) have anti-allergic, anti-anaphylactic and anti-asthmatic properties. (I) induces polydlonal antibodies specific for a target effector site on the epsilon-heavy chain of IgE, and so preventing triggering and activation of mast cells and basophils and downregulation of IgE synthesis. Conjugates, or fusion peptides, allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy dermattis. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (I) that include a promiseuous T helper cell epitope (functional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           maximize cross-reactivity to the natural target. They induce safe (non-
anaphylactogenic) antibodies. AAY79994 to AAY80084 represent amino acid
sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Immunoglobulin E; IgE; epsilon heavy chain; antigenic; antigen; immunoglobenic; immunosfimulatory; carrier protein; helper T cell epitope; antibody; allergy; allergic disease; immunisation; anti-allergic; anti-anaphylactic; anti-asthmatic; asthma; anaphylaxis; dermatitis.
rhinitis, allergic asthma, food allergies, or atopic dermatitis), non-
atopic hypersensitivity conditions (such as anaphylaxis, and urticaria
hives). The present sequence represents an IGE heavy chain amino acid
sequence, which is given in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New antigenic peptide from the CH3 domain of immunoglobulin E, fusions for immunization against allergy.

The products of the invention are capable of neutralising IgE activity and have antiallergic activity. The polyuncleotides of the invention are used to produce recombinant IgE (II), and this is used to raise specific monoclonal antibodies (MAb). Both (II) and MAb are useful for diagnosis, particularly of allergy in horses, and MAb can also be used for treatment of allergies. (I) make possible production of isotype-specific antibodies, important for precise evaluation of the immune response. This
(functional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints disulfide bridge) to stabilise conformational features and maximize cross-reactivity to the natural target. They induce safe (non-anaphylactogenic) antibodies, AAY79994 to AAY80084 represent amino acid sequences used in the exemplification of the present invention
                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DNA sequence encoding part of an equine immunoglobulin G, useful for preparing isotype-specific antibodies for diagnosis and treatment of allergy in horses.
                                                                                                                                                                                                                                                                                                                                                                                                                                          Cea, equine, horse, heavy chain, constant region, allotype a, 1gE, C-epsilon a, immunoglobulin E, antiallergic, allergy.

The products of the invention are capable of neutralising 1gB activity and have antiallergic activity. The polymucleotides of the invention are used to produce recombinant 1gE (II), and this is used to raise specific monoclonal antibodies (MAB). Both (II) and MAB can useful for diagnosis, particularly (I make possible production of isotype-specific altibodies, important for precise evaluation of the immune response. This sequence represents a fragment of the equine 1gE heavy chain constant region C-epsilon allotype b (Ceb), used in the method of the invention for IgE-isotype recombinant immunoglobulin production
sequence represents a fragment of the equine IgE heavy chain constant region C-epsilon allotype a (Cea), used in the method of the invention for IgE-isotype recombinant immunoglobulin production

Wang CY, Walfield AM; WPI; 2000-160578/14.  New antigenic peptide from the CH3 domain of immunoglobulin E, fusions for immunization against allergy.  Claim I; Page 146; 155pp; English.  Claim I; Page 146; 155pp; English.  The present invention describes immunoglobulin E (1gE)-CH3 domain antigenic peptides (I). (I) have anti-allergic, anti-anaphylactic and antigenic peptides (I). (I) induces polyclonal antibodies specific for a target effector site on the epsilon-heavy chain of 1gE, and so a target effector site on the epsilon-heavy chain of 1gE, and so downregulation of 1gE synthesis. Conjugates, or fusion peptides, containing (I) are used for active immunisation against 1gE-mediated dermatities. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines.  Conjugates of (I) that include a promiscuous T helper cell epitope

"Genome-based analysis of virulence genes in a non-biofilm-forming Staphylococcus epidermidis strain (ATCC 12228).",

Mol. Microbiol. 49:1577-1593 (2003).

-i- SIMILARITY: Belongs to the GTP-binding elongation factor family.

LepA subfamily.
  Proc. Natl. Acad. Sci. U.S.A. 98:4136-4141(2001).

-!- SUBCELLULAR LOCATION: PRESENT IN THE CYTOPLASMIC MEMBRANE AND IS
ALSO FOUND IN THE PERIPLASM (BY SIMILARITY).
-!- SIMILARITY: Belongs to the GTP-binding elongation factor family.
LepA subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

C;Complex: An immunoglobulin neterotetramer subunit consists of two identical light (kaj hain disulfide bonds. In some cases, such as IgA and IgM, the subunits associate into 1:
C;Superfamily: immunoglobulin c region; immunoglobulin homology
C;Reywords: alternative splicing; duplication; glycoprotein; heterotetramer; immunogloby
F;22-87/Domain: immunoglobulin homology <IM3>
F;232-301/Domain: immunoglobulin homology <IM3>
F;34-07/Domain: immunoglobulin homology <IM4>
F;14/Disulfide bonds: interchain (to light chain) #status predicted
F;15-105,29-85,135-193,329-299,345-405/Disulfide bonds: #status predicted
F;21,49,99,146,252,275/Binding site: carbobydyacae (dan) (covalent) #status experimental
F;21,209/Disulfide bonds: interchain (to heavy chain) #status predicted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             C;Accession: 168730
